

ALMA simulation for proposals

Woojin Kwon

Korea Astronomy and Space Science Institute

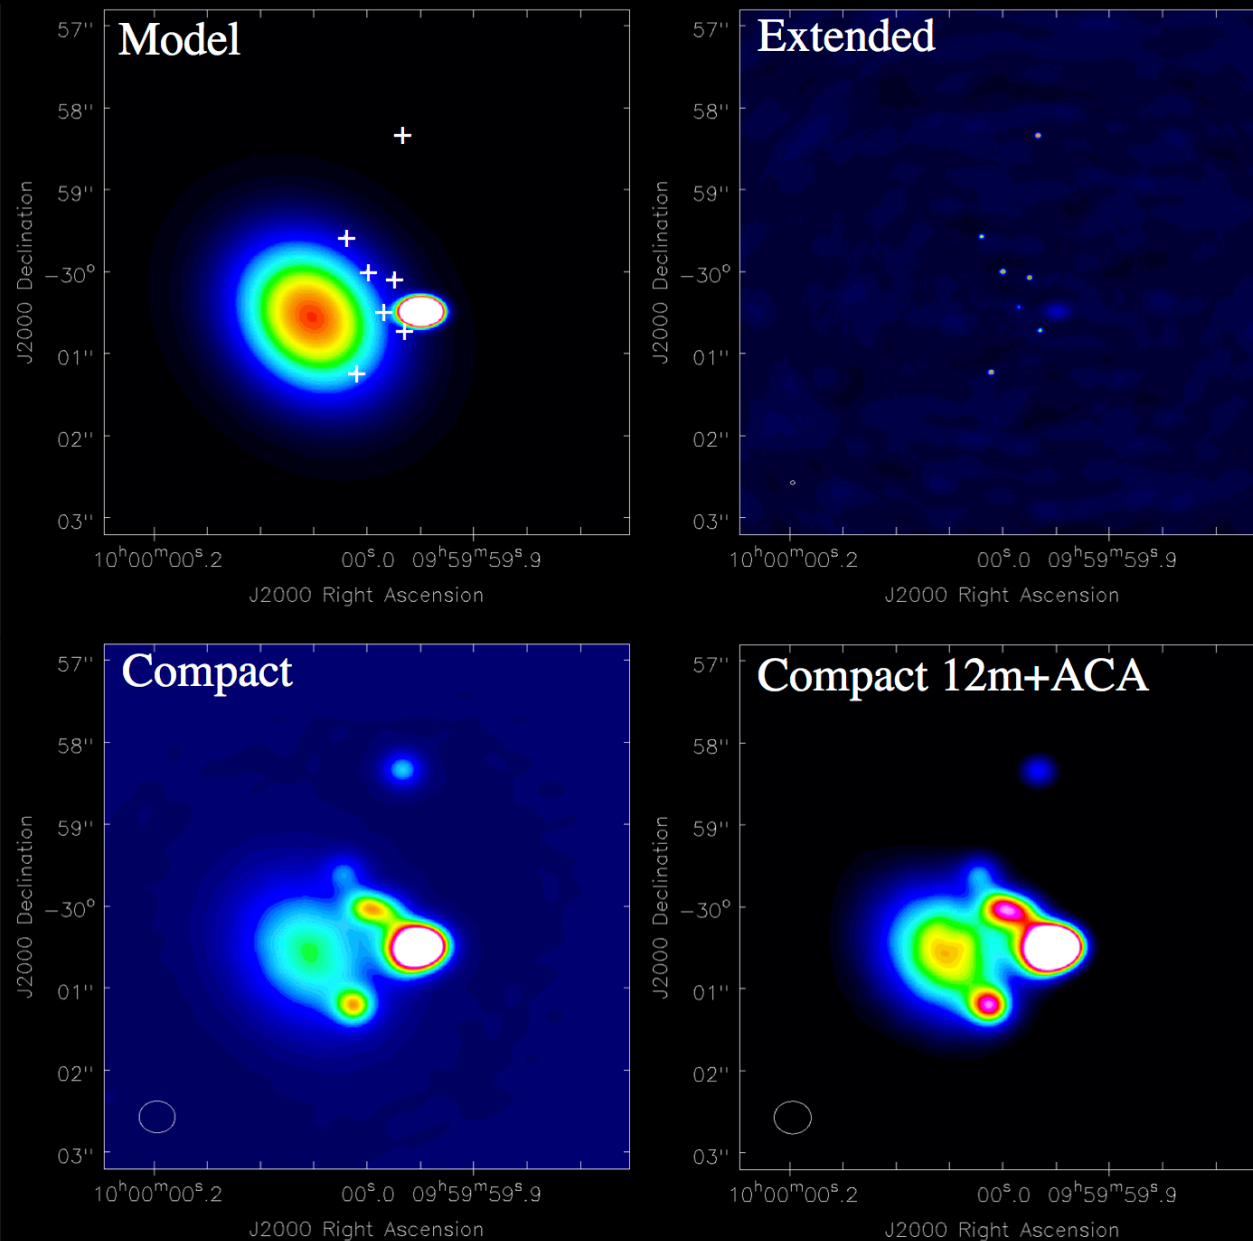

2015 April 3

Why?

- Mock observations of ALMA
- **Not necessary**, however:
- **Show whether your science can be done by ALMA**
- Verify what you need for your science goals:
e.g., which configurations

- Comparison of different array configurations

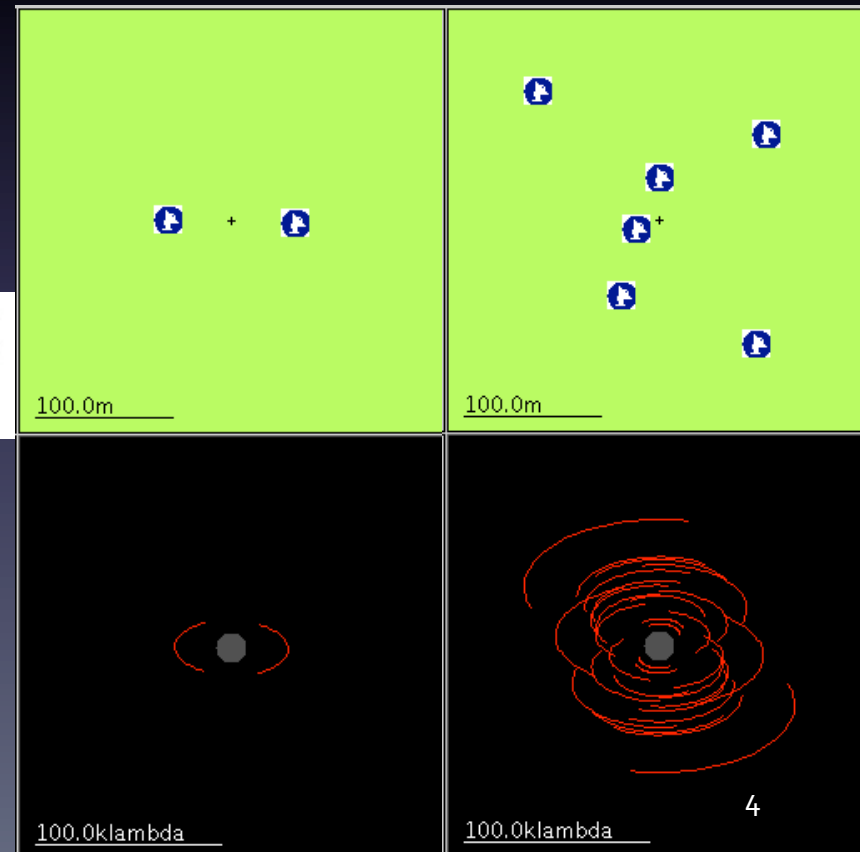

Basics of Interferometry

- Interferometer data : uv visibility
 - Power corresponding to the correlation of the waves received at two antennas
 - **FT relation with sky intensity**
 - (u, v) coordinates

$$V(u, v) \Leftrightarrow A_N(l, m) I(l, m).$$

$$S(u, v) V(u, v) \Leftrightarrow FT^{-1}[S(u, v)] * FT^{-1}[V(u, v)] \\ B_D(l, m) * [A_N(l, m) I(l, m)].$$

- Keywords
uv coverage, uv distance,
synthesized beam, primary beam...

$$V(u, v) \rightleftharpoons A_N(l, m) I(l, m).$$

$$S(u, v) V(u, v) \rightleftharpoons FT^{-1}[S(u, v)] * FT^{-1}[V(u, v)] \\ B_D(l, m) * [A_N(l, m) I(l, m)].$$

- **Simulating interferometric data (visibilities)**

1. sky intensity distribution: $I(l, m)$
2. primary beam correction: $A_N(l, m) I(l, m)$
3. FT
4. Sampling in $V(u, v) \rightarrow S(u, v) V(u, v)$

- **Interferometric data reduction**

1. data: $S(u, v) V(u, v)$
2. IFT
3. de-convolution of $B_D(l, m)$ to find $A_N(l, m) I(l, m)$

Two approaches

- CASA simulation tools
- Observation support tool (OST)

EU ARC, University of Manchester

Web-based

<http://almaost.jb.man.ac.uk>

CASA 123

- Common Astronomy Software Applications
<http://casa.nrao.edu>
- Install CASA - version 4.3.1
- ```
> casapy
: tasklist
: taskhelp
: inp(<task>)
: project = 'sim' (example of putting in a parameter value)
.....
: go (or a task name)
```

# CASA simulation tools

- CASA version 4.3  
[http://casaguides.nrao.edu/index.php?title=Simulating\\_Observations\\_in\\_CASA\\_4.3](http://casaguides.nrao.edu/index.php?title=Simulating_Observations_in_CASA_4.3)
- **Simobserve**  
generate visibilities
- **Simanalyze**  
produce a cleaned image
- (Simalma)  
particular cases with total power antennas

# Caveats

- RMS noise should not be used for proposals
- 20% underestimates for both surface brightness and total flux in single dish maps

# What you need

- Possible starting points: e.g.,  
images taken at a different wavelength  
numerical simulation results  
knowledge on object size and total flux

# Simobserve

```
CASA <32>: inp
-----> inp()

simobserve :: visibility simulation task
project = 'sim' # root prefix for output file names
skymodel = '30dor.fits' # model image to observe
inbright = '0.06mJy/pixel' # scale surface brightness of brightest pixel
 # e.g. "1.2Jy/pixel"
indirection = 'J2000 10h00m00 -40d00m00' # set new direction e.g. "J2000 19h00m00
 # -40d00m00"
incell = '0.15arcsec' # set new cell/pixel size e.g. "0.1arcsec"
incenter = '230GHz' # set new frequency of center channel e.g.
 # "89GHz" (required even for 2D model)
inwidth = '2GHz' # set new channel width e.g. "10MHz" (required
 # even for 2D model)

complist = '' # componentlist to observe
setpointings = True #
integration = '600s' # integration (sampling) time
direction = '' # "J2000 19h00m00 -40d00m00" or "" to center on
 # model
mapsize = ['', ''] # angular size of map or "" to cover model
maptype = 'ALMA' # hexagonal, square (raster), ALMA, etc
pointingspacing = '' # spacing in between pointings or "0.25PB" or ""
 # for ALMA default INT=lambda/D/sqrt(3),
 # SD=lambda/D/3

obsmode = 'int' # observation mode to simulate
 # [int(interferometer)lsd(singledish)l""(none)]
antennalist = 'alma.cycle3.1.cfg' # interferometer antenna position file
refdate = '2014/05/21' # date of observation - not critical unless
 # concatting simulations
hourangle = 'transit' # hour angle of observation center e.g.
 # "-3:00:00", "5h", "-4.5" (a number without
 # units will be interpreted as hours), or
 # "transit"
totaltime = '7200s' # total time of observation or number of
 # repetitions
caldirection = '' # pt source calibrator [experimental]
calflux = '1Jy' #
```

- Generate visibilities
- 30 Dor

```
thermalnoise = 'tsys-atm' # add thermal
user_pwv = 0.5 # Precipitable
t_ground = 269.0 # ambient temp
seed = 11111 # random number

leakage = 0.0 # cross polari
graphics = 'both' # display grap
 # [screenfil
verbose = False #
overwrite = True # overwrite fi
```

CASA <29>: □

- Outputs:

[sim.alma.cycle3.1.ptg.txt](#)

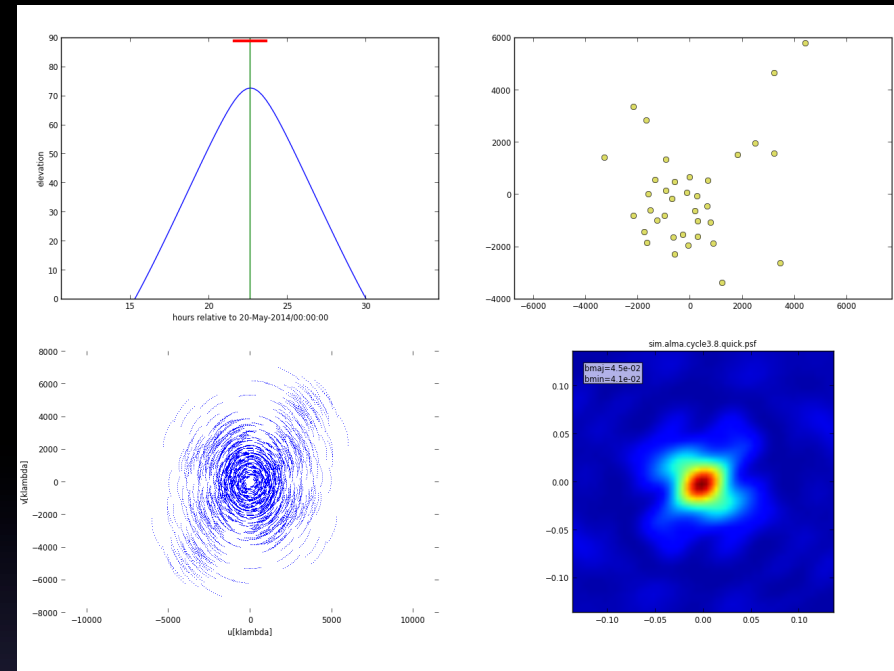

[sim.alma.cycle3.1.quick.psf/](#)

[sim.alma.cycle3.1.simobserve.last](#)

[sim.alma.cycle3.1.skymodel/](#)

[sim.alma.cycle3.1.skymodel.flat/](#)

[sim.alma.cycle3.1.skymodel.png](#)

# Simanalyze

```
CASA <46>: inp
-----> inp()
simanalyze :: image and analyze measurement sets created with simobserve
project = 'sim' # root prefix for output file names
image = True # (re)image $project.*.ms to $project.image
vis = 'sim.alma.cycle3.1.ms' # Measurement Set(s) to image
modelimage = '' # lower resolution prior image to use in clean
 # e.g. existing total power image
imsize = 0 # output image size in pixels (x,y) or 0 to match
 # model
imdirection = '' # set output image direction, (otherwise center
 # on the model)
cell = '0.15arcsec' # cell size with units e.g. "10arcsec" or "" to
 # equal model
interactive = False # interactive clean? (make sure to set niter>0
 # also)
niter = 0 # maximum number of iterations (0 for dirty
 # image)
threshold = '0.1mJy' # flux level (+units) to stop cleaning
weighting = 'natural' # weighting to apply to visibilities. briggs
 # will use robust=0.5
mask = ☐ # Cleanbox(es), mask image(s), region(s), or a
 # level
outertaper = ☐ # uv-taper on outer baselines in uv-plane
pbcor = True # correct the output of synthesis images for
 # primary beam response?
stokes = 'I' # Stokes params to image
featherimage = '' # image (e.g. total power) to feather with new
 # image

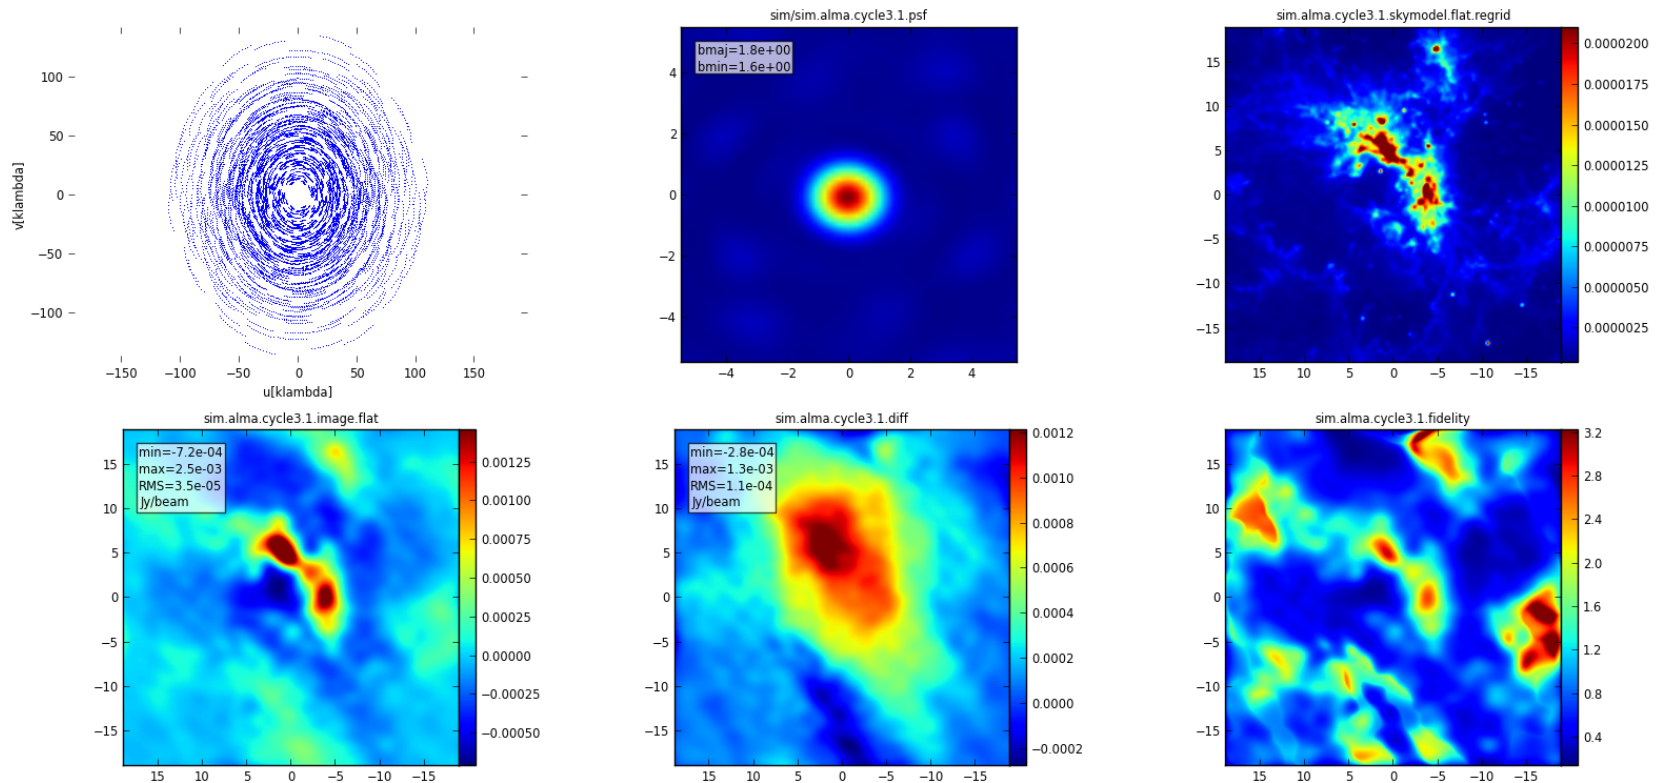

analyze = True # (only first 6 selected outputs will be
 # displayed)
showuv = True # display uv coverage
showpsf = True # display synthesized (dirty) beam (ignored in
 # single dish simulation)
showmodel = True # display sky model at original resolution
showconvolved = False # display sky model convolved with output clean
 # beam
showclean = True # display the synthesized image
showresidual = False # display the clean residual image (ignored in
 # single dish simulation)
```

- Generate  
(cleaned) image

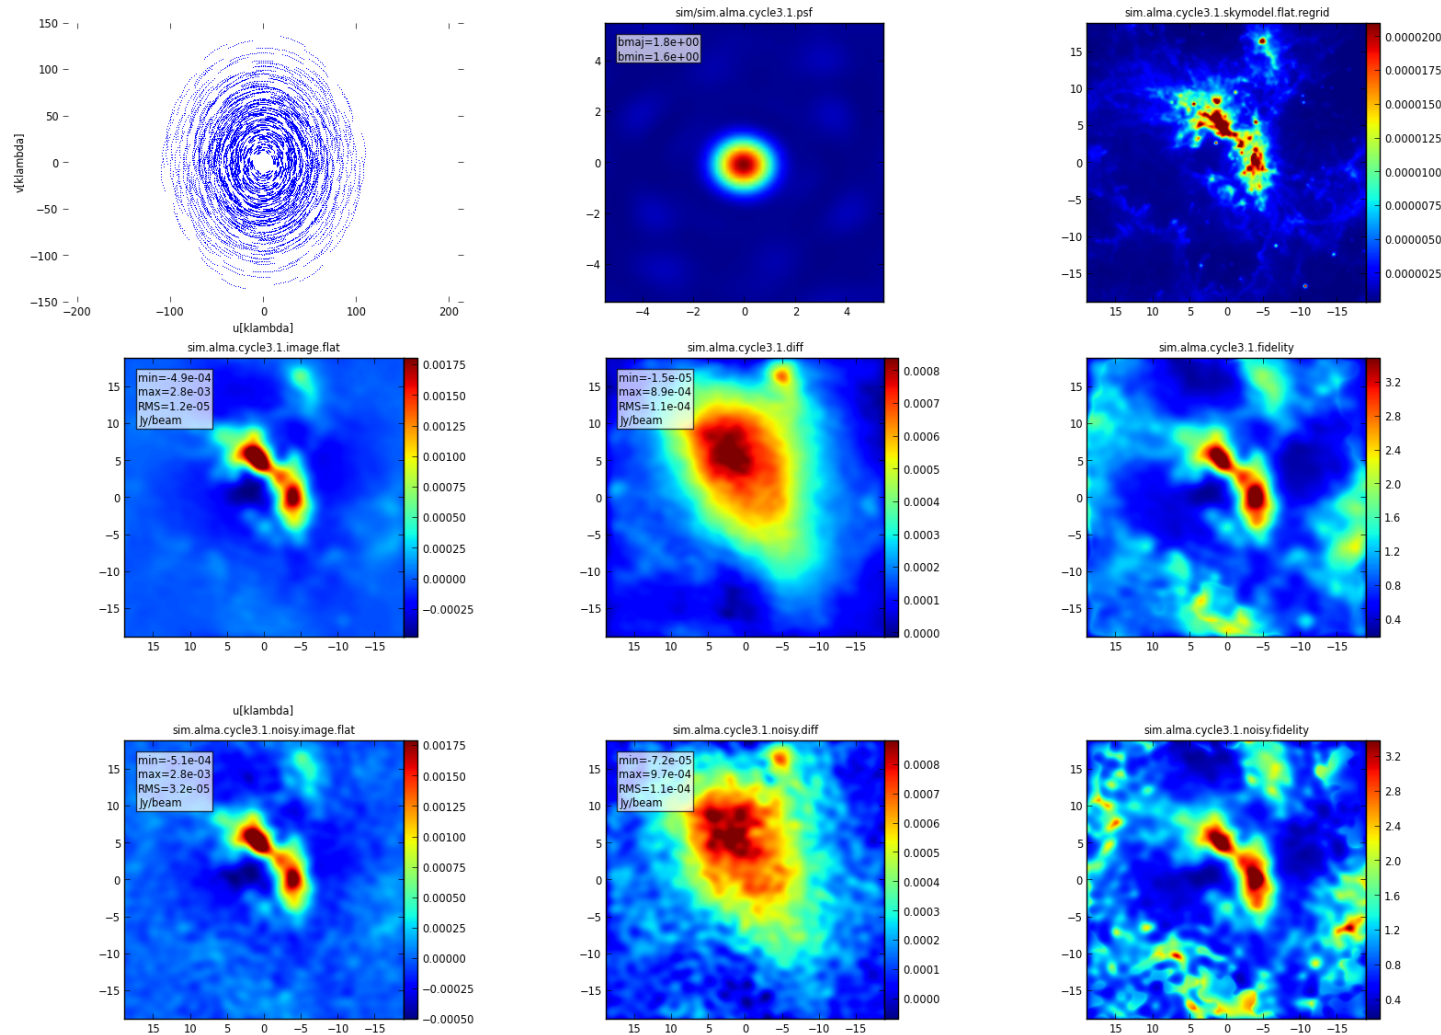

```
showdifference = True # display difference
 # and input model
showfidelity = True # output clean beam
 # display fidelity
graphics = 'both' # display graphics
 # [screen|file|both]
verbose = False #
overwrite = True # overwrite files
dryrun = False # only print information
 # interferometric
logfile = ''
```

CASA <47>: ☐

- Outputs: uv coverage, dirty beam, model, (clean) image, difference, fidelity
- viewer

- Comparison of cases with and without noise

# OST

- Web-based
- Results can be delayed depending on job load
- <http://almaost.jb.man.ac.uk>

## ALMA Observation Support Tool

Version 3.0

OST NEWS HELP QUEUE LIBRARY ALMA HELPDESK

Updated: Important information on the new OST version.

### Array Setup:

Instrument:

Select the desired ALMA antenna configuration.

### Sky Setup:

Source model:

Choose a library source model or supply your own.

Upload:  No file chosen

You may upload your own model here (max 10MB).

Declination:

Ensure correct formatting of this string (+/-00d00m00.0s).

Image peak / point flux in

Rescale the image data with respect to new peak value.

Set to 0.0 for no rescaling of source model.

### Observation Setup:

Observing mode: ☐ Spectral ☒ Continuum

Spectral or continuum observations?

Central frequency in GHz:

The value entered must be within an ALMA band.

Bandwidth in

Select the total bandwidth for continuum observations.

Enter 7.5 GHz to select ALMA recommend full continuum setup.

Number of polarizations:

This affects the noise in the final map.

Required resolution in arcseconds:

OST will choose array config based on this value if *instrument* is set to ALMA.

Pointing strategy:

Selecting single will apply primary beam attenuation.

On-source time in

Per pointing for mosaics.

Start hour angle:

Deviation of start of observation from transit.

Number of visits:

How many times the observation is repeated.

Include cycling to phase calibrator?: ☐ Yes ☒ No

This affects the *uv*-coverage of your simulation.

### Atmospheric Corruption:

Atmospheric conditions:

Determines level of noise due to water vapour.

### Imaging Product:

Imaging weights:

This allows a resolution / sensitivity trade-off.

Perform deconvolution?:

Apply the CLEAN algorithm to deconvolve the image.

Output image format:

CASA format images are returned as a tar file

### Messages

- The brightness unit of your uploaded sky model was not recognised and has been adjusted to Jy/pixel. You should carefully check that your sky model remains sensible, and consider tuning the rescaling value to compensate for any discrepancies.
- The peak pixel of your model image has been rescaled to 0.06 mJy
- The maximum image dimension that can be processed is 2048 pixels, thus a portion of the model may be outside of your simulated map. Consider relaxing the resolution demands or simulating a smaller patch of sky.
- Your simulated observation requires more than 30 pointing directions. To prevent clutter these have not been plotted on the images below.

### Overview

Click thumbnails to view full-size images. Left: linear colour scale, right: with histogram equalization.

Array configuration: ALMA out02

Source model: 30dor.fits

Input image:

Maximum elevation: 72.88 degrees

Central frequency: 230 GHz (ALMA Band 6)

Total Bandwidth: 7.5 GHz

Track length: 2 hours x 1.0 visits

Hexagonal mosaicing : 1817 required to cover requested sky area with uniform sensitivity

System temperature: Tsys = 83.1356846157 K

PWV : 0.475 mm

Theoretical RMS noise: 6.25586380064e-06 Jy (in naturally-weighted map)

Restoring beam (resolution): Major axis = 1.68 arcsec, minor axis = 1.528 arcsec, PA = 92.712 deg

### For use with CASA simdata

Input sky model: [Download processed model in FITS format](#)
